

Package: DEploid (via r-universe)

October 19, 2024

Type Package

Title Deconvolute Mixed Genomes with Unknown Proportions

Version 0.5.4

Description Traditional phasing programs are limited to diploid organisms. Our method modifies Li and Stephens algorithm with Markov chain Monte Carlo (MCMC) approaches, and builds a generic framework that allows haplotype searches in a multiple infection setting. This package is primarily developed as part of the Pf3k project, which is a global collaboration using the latest sequencing technologies to provide a high-resolution view of natural variation in the malaria parasite *Plasmodium falciparum*. Parasite DNA are extracted from patient blood sample, which often contains more than one parasite strain, with unknown proportions. This package is used for deconvoluting mixed haplotypes, and reporting the mixture proportions from each sample.

dEploid	<i>Deconvolute mixed haplotypes</i>
---------	-------------------------------------

Description

Deconvolute mixed haplotypes, and reporting the mixture proportions from each sample This function provides an interface for calling *dEploid* from R. The command line options are passed via the `args` argument

Usage

```
dEploid(args)
```

Arguments

`args` String of dEploid input.

Value

A list with members of haplotypes, proportions and log likelihood of the MCMC chain.

- Haps Haplotypes at the final iteration in plain text file.
- Proportions MCMC updates of the proportion estimates.
- llks Log likelihood of the MCMC chain.

Seeding

The R version of DEploid uses random number from R's random generator. Therefore, the `'-seed'` argument of the command line version will be ignored, and no seed is given in the output. Use the R function `'set.seed'` prior to calling this function to ensure reproducibility of results.

See Also

- `vignette('dEploid-Arguments')` for an overview of commandline arguments

Examples

```
## Not run:
vcfFile = system.file("extdata", "PG0390-C.test.vcf.gz", package = "DEploid")
plafFile = system.file("extdata", "labStrains.test.PLAF.txt", package = "DEploid")
set.seed(1234)
PG0390.deconv = dEploid(paste("-vcf", vcfFile, "-plaf", plafFile, "-noPanel"))

## End(Not run)
```

altFileName	Path of the alternative allele count file.

Value

A data.frame contains four columns: chromosomes, positions, reference allele count, alternative allele count.

Note

The allele count files must be tab-delimited. The allele count files contain three columns: chromosomes, positions and allele count.

Examples

```
refFile = system.file("extdata", "PG0390-C.test.ref", package = "DEploid")
altFile = system.file("extdata", "PG0390-C.test.alt", package = "DEploid")
